Education

McMaster University

Sept 2025 – April 2029

Bachelor of Applied Science in Computer Science (Co-op)

GPA: 3.92/4.0 | Minor: Innovation

Skills

AI & Agents: LLMs, LangGraph, Multi-Agent Systems, RAG, NLP, Information Extraction, Gemini API, ElevenLabs, n8n

Languages: Python, TypeScript, JavaScript, C++, SQL

App / Web: FastAPI, Node.js, Express.js, React.js, Angular, REST APIs

Cloud / Data: GCP (BigTable, Cloud SQL), AWS, Azure, MongoDB, OpenLayers

DevOps: Docker, GitLab CI, Git, Playwright

Experience

IGEO Consultants

May 2026 – Aug 2026

AI/ML and DevOps Intern

Mississauga, ON

- Built Node.js and Python data pipelines that ingest satellite imagery reporting from commercial providers, open source feeds and social platforms, turning unstructured text and PDF reports into structured MongoDB records.
- Developed information extraction and summarization logic that pulls facility names, locations, quantities and dates out of raw analyst reports and resolves them to precise coordinates via a curated gazetteer with geocoding fallback.
- Shipped full stack features across Angular and Node.js, including an interactive OpenLayers map with clickable geospatial pins, side by side imagery comparison and place search accepting facility names or raw coordinates.
- Automated recurring collection with scheduled jobs, adding rate limit handling, caching and retry logic so external sources stay inside usage limits.
- Supported DevOps with Docker and GitLab CI, diagnosing and fixing a production build failure that would have broken the deployment pipeline.

Google Developer Student Clubs (GDSC)

Sept 2025 – May 2026

Open Source AI Developer (InterfaceAI)

Hamilton, ON

- Architected a Step Creator Agent in LangGraph that converts natural language goals into executable browser trajectories, applying declarative planning and agentic reasoning over multi-step tasks.
- Engineered a Memory AI Agent with Python and GCP BigTable to persist user context across autonomous browser sessions, enabling stateful LLM workflows and reducing redundant setup across runs.

Needpedia

May 2023 – Feb 2024

Software Developer

Remote

- Built full stack features in Python and React.js, shipping 5+ internal tools that cut manual task overhead by 25%.
- Optimized Node.js ingestion pipelines to handle 5,000+ requests/hour, improving reliability across internal data workflows.

Projects

Switchboard (VS Code Extension) | *TypeScript, VS Code API, Node.js, Multi-Agent Systems*

- Built a multi-agent orchestration system that routes tasks across Codex, Cursor, Claude and Gemini through a Leader/Worker architecture, coordinating reasoning across heterogeneous models.
- Implemented diff tracking, workflow trees and resumable thread memory so agents can inspect file changes, delegate sub-tasks and continue sessions with persistent context.

AI-MER (Agentic Matchmaking Platform) | *Python, Gemini API, ElevenLabs, MongoDB*

- Digital Twin LLM agents simulate speed dating conversations with voice first onboarding, scored by an EMA telemetry engine that smooths sentiment volatility.

Ventures

Jobbler.ai | *Founder*

Jul 2026 – Present

- Building an autonomous job application agent that parses postings, tailors applications and submits them without manual input, running daily in production.

SkinC | *Co-Founder*

2026 – Present

- Launched an AI skin analysis app on the Apple App Store, building the full stack across mobile, backend and cloud including auth, subscriptions and AI generated reports.
